Auto Start-Stop

For electric pressure washers

PW 30-013M

Why Auto Start/Stop?

Auto Start/Stop will automatically shut down the pressure washer after the trigger on the gun has been released and then start up again as soon as the trigger is pulled. The operator can leave the pressure washer when the job is done without having to walk over to the machine and turn it on and off all day long, thus ensuring years of trouble free operation. One of the primary reasons for pump failure on pressure washers is leaving the unit running without the trigger on the gun being pulled. This recirculation of water in the pump will eventually get hot and when the trigger is pulled again, the cold water that enters the pump can crack the ceramic pistons as well as damage the seals.

Remember to ensure the unit is turned off at the end of the day!
